```
# CAP 6635 Artificial Intelligence
# Local search (Hill Climbing and Simulated Annealing to solve N-Queens problem)
# X. Zhu, June. 15 2023
# Code adapted from: https://github.com/TranDatDT/n-queens-simulated-annealing/blob/master/main.py

# Modified by Matthew Acs for HW 2

# Set number of questions (N) as 8, 16, 32, 64, respectively.
# Repeat hill-climbing search (HC) and simulated annealing (SA) 10
# times for each N values, calculate average runtime and success rates
# (1 divided by number of repetitions before success).

# For simulated annealing method (SA), fix the number of Queen to 64,
# and vary the initial temperature from T=4000 to T=[400, 40, 4, 0.4],
# respectively.

# Code modified to run for N=8, 16, 32, and 64
# Code modified to loop through 10 iterations for each N value and take average runtime and success rate
# Code modified to test SA for T = 4000, 400, 40, 4, 0.4
```
